

Protecting every mother, child and community, in every language, before risk becomes crisis.

AI-POWERED COMMUNITY HEALTH · MATERNAL & CHILD CARE · CLIMATE-HEALTH EARLY WARNING · POWERED BY N-ATLAS

Nigeria loses tens of thousands of mothers and children every year to causes we already know how to prevent: missed antenatal care, missed vaccines, malaria, and late access to care. Millions more adults live with undiagnosed hypertension and diabetes. The information exists, but it rarely reaches families **in their own language, at the right moment, with a clear next step.**

>1 in 4	~2.1M	~1 in 4	~1 in 3
of the world's maternal deaths occur in Nigeria	zero-dose children in Nigeria, among the highest globally	of global malaria cases occur in Nigeria; pregnant women and under-5s are most at risk	Nigerian adults estimated to have hypertension, many undiagnosed

Sources: WHO maternal mortality estimates (2023); WHO/UNICEF WUENIC (2023); WHO World Malaria Report (2024); WHO/peer-reviewed NCD prevalence studies.

The Solution

Lafiya AI (*lafiya*: “health” in Hausa) is a multilingual, voice-first health platform built on **N-ATLAS**. It gives every family a trusted **Community Health & Care Navigator** that delivers person-facing health information, prevention and access to services, from pregnancy through childhood and across adult life. It warns communities **before** climate-driven disease risk arrives, and gives government a live view of where people are being missed.

“A mother asks in Yoruba which vaccine her 6-week-old needs next. Lafiya answers by voice, books the reminder, points her to the nearest open clinic, and warns her that malaria risk in her LGA is rising this week.”

One Platform, Four Integrated Services

Service	What it does	Who benefits
Care Navigator	The front door. Voice and chat health guidance in Hausa, Yoruba, Igbo, Pidgin and English; prevention advice (hypertension, diabetes, nutrition, hygiene); symptom-to-service referral; nearest facility and available services.	Every household and individual
MamaCare	Pregnancy tracking, antenatal visit schedule, danger-sign education, newborn and child milestone guidance to age five.	Pregnant women, mothers, caregivers
ImmuniTrack	Personal vaccine schedule and reminders; coverage-gap mapping by State, LGA and ward.	Families, health workers, government
ClimateGuard	Live weather data drives malaria, heat and flood risk scores per LGA, with personalised early-warning alerts.	Communities, high-risk groups, planners

The Intelligence Loop: what makes Lafiya different

1. Sense Weather, outbreak and coverage data ingested daily	2. Match Risk is matched to the people it affects: pregnant women, under-5s, people with hypertension	3. Speak N-ATLAS writes and voices a personal message in each user's language	4. Act The Care Navigator routes them to the nearest service	5. See Government sees risk and response on one live dashboard

Why N-ATLAS Is Essential, Not Optional

Most Nigerian families do not get health information in English text. Lafiya is **voice-first and local-language-first**: N-ATLAS turns WHO and NPHCDA guidance into clear, culturally appropriate conversation, and turns complex risk data into a single sentence a mother or a community health worker can act on. Without N-ATLAS, the product does not exist.

Why Now, Why Lafiya

National priority fit	Directly supports maternal and child survival, routine immunization recovery, malaria elimination and climate adaptation, which are all current federal and donor priorities.
Home-grown AI	Showcases N-ATLAS as Nigerian AI solving Nigerian problems at population scale.
Ready to build	Built on trusted public-health data; the MVP is ready to build and demo now.

Three-Sided Value

Segment	What they get
Families & individuals	Free, trusted health guidance by voice; pregnancy, vaccine and check-up reminders; prevention for chronic disease; risk alerts; nearest clinic and services.
Health workers & PHCs	Due and overdue lists for mothers and children, high-risk weeks flagged, follow-up prompts, and a navigator that sends patients to the right facility.
Government, NGOs & donors	Immunization-gap and climate-risk maps, LGA dashboards, demand signals for services, exportable reports and an open API.

Why Lafiya Wins Against Existing Solutions

Today's options	Their limitation	The Lafiya advantage
SMS reminder apps	Text-only and English-heavy; one-way; one programme each	Two-way voice conversation in local languages across the whole life course
Health dashboards	Built for officials; never reach the family at risk	Same insight drives both the dashboard and a personal alert to the household
Weather alerts	Generic warnings with no health meaning or next step	Risk translated into a specific health action and the nearest service
Generic AI chatbots	Not grounded in Nigerian guidance or languages	Built on N-ATLAS and national health guidance, designed for Nigerian communities

How We Measure Impact

Families reached	Active users by language, State and LGA; share of pregnant women and caregivers enrolled
Care completed	Antenatal visits attended; vaccines given on time; zero-dose children reached
Risk acted on	Alerts opened and acted on; malaria tests and net use during high-risk weeks
Access improved	Referrals completed to facilities; chronic-disease check-ups prompted

Market & Sustainability

Channel	Buyer / partner	Model
Government licensing	State Ministries of Health, SPHCDA, NPHCDA	Annual platform licence per state
Programme contracts	UNICEF, WHO, Gates Foundation, Gavi, Global Fund	Deployment and analytics for funded programmes
Strategic partnerships	Telcos, HMOs, NHIA	Zero-rated access, SMS/voice delivery, member engagement
Insights API	NGOs, researchers, climate-health programmes	Anonymised, aggregated data subscriptions
Families	Households	Always free , which drives adoption and impact

Responsible by Design

Medical safety	Content grounded in WHO/NPHCDA guidance. Lafiya educates and refers; it never diagnoses.
Data protection	Compliant with the Nigeria Data Protection Act 2023: consent-first, minimal data, aggregated dashboards.
Inclusion	Voice-first for low literacy, SMS fallback, USSD/IVR for basic phones on the roadmap.
Explainable risk	Malaria and heat scores use published, transparent thresholds, and every alert says why.

Delivery Roadmap

Phase	Scope	Outcome
MVP (challenge)	Care Navigator voice assistant, MamaCare + ImmuniTrack schedules, ClimateGuard risk by LGA, personalised alerts, facility finder, government dashboard	Working end-to-end demo
Pilot (6 months)	2 states, 3 languages, CHW workflows, SMS delivery, NCD prevention tracks	Measured reach and referrals
Scale (12–24 months)	USSD/IVR, DHIS2 integration, cholera/Lassa/meningitis models, telco & HMO partners	National rollout

Our ask: support to pilot Lafiya AI in two states with State Primary Health Care Development Agencies, so that N-ATLAS reaches the families who need it most, in the language they speak.
